Data Structure

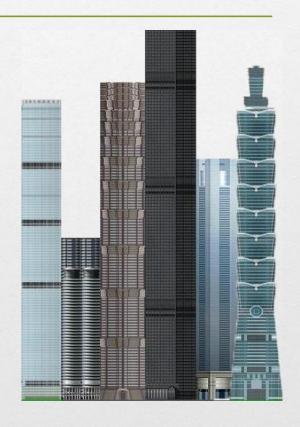

Programming assignment 1

Problem1

- According to the teacher's class, please implement the following functions of the stack.
- push(): Put the data in the top of the stack.
- pop(): Delete the data in the top of the stack.
- top(): View the data in the top of the stack.

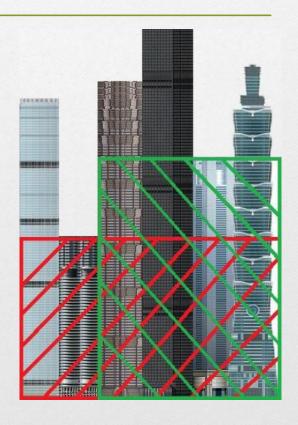

Problem2

今天校方想要做一張非常醒目的廣告,因此,需要一個矩形範圍最大的牆面,考慮到不同建築的高度不同,我們想做的事情就是在不超出建築物的情況下來達到這個條件才行。

Problem2

• 今天給定建築物高度為[5,4 ,6,7,6,6],則我們可以發現 到最大的牆面為24,受限於 高度為4的建築,我們只能 提供4x6的範圍。但還有另 一種方案,那就是使用後面 4棟建築物也可以達成,變 成6x4的範圍。今天我們被 要求必須找出24這個答案 才行。

Assumptions

- 假設每個建築物每層樓高度都相同。
- 假設每個建築物寬度也都相同。
- 只需考慮最後輸出的最大牆面即可。
- 使用您寫的stack來解決此問題即可,我們可以 將建築物高度遞增時放入stack,遞減時來移出 堆疊。

Requirement

- Please use python3 to write the program.
- Please fill in the code of Problem1 corresponding to the function in hw1.py.
- Please fill in the code of Problem2 in the function named solution in hw1.py.
- Execute your code to know your score and the wrong place of the code.

Input & Output

• The input to the function is a list representing the height of each building, and the output can only number representing the size of area.

Score

- Code 100%, 10% of each data.
- We will use the same data in the sample program to check the correctness of program.
- 請將檔案壓縮為 zip 檔再上傳, zip 檔名不限, 然而程式碼請以 programming_hw1.py 做繳交。
